

Python Operators

Operators are used to perform operations on variables and values.

Python divides the operators in the following groups:

- Arithmetic operators
- Assignment operators
- Comparison operators
- Logical operators
- Identity operators
- Membership operators
- Bitwise operators

Python Arithmetic Operators

Arithmetic operators are used with numeric values to perform common mathematical operations:

Operator	Name	Example
<code>+</code>	Addition	<code>x + y</code>
<code>-</code>	Subtraction	<code>x - y</code>
<code>*</code>	Multiplication	<code>x * y</code>
<code>/</code>	Division	<code>x / y</code>
<code>%</code>	Modulus	<code>x % y</code>
<code>**</code>	Exponentiation	<code>x ** y</code>
<code>//</code>	Floor division	<code>x // y</code>

Python Assignment Operators

Assignment operators are used to assign values to variables:

Operator	Example	Same As
=	x = 5	x = 5
+=	x += 3	x = x + 3
-=	x -= 3	x = x - 3
*=	x *= 3	x = x * 3
/=	x /= 3	x = x / 3
%=	x %= 3	x = x % 3
//=	x //= 3	x = x // 3
**=	x **= 3	x = x ** 3
&=	x &= 3	x = x & 3
=	x = 3	x = x 3
^=	x ^= 3	x = x ^ 3
>>=	x >>= 3	x = x >> 3
<<=	x <<= 3	x = x << 3

Python Comparison Operators

Comparison operators are used to compare two values:

Operator	Name	Example
=	Equal	x == y
!=	Not equal	x != y

>	Greater than	<code>x > y</code>
<	Less than	<code>x < y</code>
>=	Greater than or equal to	<code>x >= y</code>
<=	Less than or equal to	<code>x <= y</code>

Python Logical Operators

Logical operators are used to combine conditional statements:

Operator	Description	Example
and	Returns True if both statements are true	<code>x < 5 and x < 10</code>
or	Returns True if one of the statements is true	<code>x < 5 or x < 4</code>
not	Reverse the result, returns False if the result is true	<code>not(x < 5 and x < 10)</code>

Python Identity Operators

Identity operators are used to compare the objects, not if they are equal, but if they are actually the same object, with the same memory location:

Operator	Description	Example
is	Returns true if both variables are the same object	<code>x is y</code>
is not	Returns true if both variables are not the same object	<code>x is not y</code>

Python Membership Operators

Membership operators are used to test if a sequence is presented in an object:

Operator	Description	Example
in	Returns True if a sequence with the specified value is present in the object	x in y
not in	Returns True if a sequence with the specified value is not present in the object	x not in y

Python Bitwise Operators

Bitwise operators are used to compare (binary) numbers:

Operator	Name	Description
&	AND	Sets each bit to 1 if both bits are 1
	OR	Sets each bit to 1 if one of two bits is 1
^	XOR	Sets each bit to 1 if only one of two bits is 1
~	NOT	Inverts all the bits
< <	Zero fill left shift	Shift left by pushing zeros in from the right and let the leftmost bits fall off

> >	Signed right shift	Shift right by pushing copies of the leftmost bit in from the left, and let the rightmost bits fall off
--------	--------------------------	---
