

# R - Matrices

Matrices are the R objects in which the elements are arranged in a two-dimensional rectangular layout. They contain elements of the same atomic types. Though we can create a matrix containing only characters or only logical values, they are not of much use. We use matrices containing numeric elements to be used in mathematical calculations. A Matrix is created using the **matrix()** function.

## Syntax

The basic syntax for creating a matrix in R is –

```
matrix(data, nrow, ncol, byrow, dimnames)
```

Following is the description of the parameters used –

- **data** is the input vector which becomes the data elements of the matrix.
- **nrow** is the number of rows to be created.
- **ncol** is the number of columns to be created.
- **byrow** is a logical clue. If TRUE then the input vector elements are arranged by row.
- **dimname** is the names assigned to the rows and columns.

## Example

Create a matrix taking a vector of numbers as input.

```
# Elements are arranged sequentially by row.  
M <- matrix(c(3:14), nrow = 4, byrow = TRUE)  
print(M)
```

```
# Elements are arranged sequentially by column.  
N <- matrix(c(3:14), nrow = 4, byrow = FALSE)  
print(N)
```

```
# Define the column and row names.  
rownames = c("row1", "row2", "row3", "row4")  
colnames = c("col1", "col2", "col3")
```

```
P <- matrix(c(3:14), nrow = 4, byrow = TRUE, dimnames =  
list(rownames, colnames))  
print(P)
```

When we execute the above code, it produces the following result –

```
      [,1] [,2] [,3]  
[1,]    3    4    5
```

|      |      |      |      |
|------|------|------|------|
| [2,] | 6    | 7    | 8    |
| [3,] | 9    | 10   | 11   |
| [4,] | 12   | 13   | 14   |
|      | [,1] | [,2] | [,3] |
| [1,] | 3    | 7    | 11   |
| [2,] | 4    | 8    | 12   |
| [3,] | 5    | 9    | 13   |
| [4,] | 6    | 10   | 14   |
|      | col1 | col2 | col3 |
| row1 | 3    | 4    | 5    |
| row2 | 6    | 7    | 8    |
| row3 | 9    | 10   | 11   |
| row4 | 12   | 13   | 14   |

## Accessing Elements of a Matrix

Elements of a matrix can be accessed by using the column and row index of the element. We consider the matrix P above to find the specific elements below.

```
# Define the column and row names.
rownames = c("row1", "row2", "row3", "row4")
colnames = c("col1", "col2", "col3")

# Create the matrix.
P <- matrix(c(3:14), nrow = 4, byrow = TRUE, dimnames =
list(rownames, colnames))

# Access the element at 3rd column and 1st row.
print(P[1,3])

# Access the element at 2nd column and 4th row.
print(P[4,2])

# Access only the 2nd row.
print(P[2,])

# Access only the 3rd column.
print(P[,3])
```

When we execute the above code, it produces the following result –

```
[1] 5
[1] 13
col1 col2 col3
  6    7    8
```

| row1 | row2 | row3 | row4 |
|------|------|------|------|
| 5    | 8    | 11   | 14   |

## Matrix Computations

Various mathematical operations are performed on the matrices using the R operators. The result of the operation is also a matrix.

The dimensions (number of rows and columns) should be same for the matrices involved in the operation.

### Matrix Addition & Subtraction

```
# Create two 2x3 matrices.
```

```
matrix1 <- matrix(c(3, 9, -1, 4, 2, 6), nrow = 2)
print(matrix1)
```

```
matrix2 <- matrix(c(5, 2, 0, 9, 3, 4), nrow = 2)
print(matrix2)
```

```
# Add the matrices.
```

```
result <- matrix1 + matrix2
cat("Result of addition", "\n")
print(result)
```

```
# Subtract the matrices
```

```
result <- matrix1 - matrix2
cat("Result of subtraction", "\n")
print(result)
```

When we execute the above code, it produces the following result –

```
      [,1] [,2] [,3]
[1,]     3  -1    2
[2,]     9   4    6
```

```
      [,1] [,2] [,3]
[1,]     5   0    3
[2,]     2   9    4
```

Result of addition

```
      [,1] [,2] [,3]
[1,]     8  -1    5
[2,]    11  13   10
```

Result of subtraction

```
      [,1] [,2] [,3]
[1,]    -2  -1   -1
[2,]     7  -5    2
```

### Matrix Multiplication & Division

```
# Create two 2x3 matrices.
matrix1 <- matrix(c(3, 9, -1, 4, 2, 6), nrow = 2)
print(matrix1)
```

```
matrix2 <- matrix(c(5, 2, 0, 9, 3, 4), nrow = 2)
print(matrix2)
```

```
# Multiply the matrices.
result <- matrix1 * matrix2
cat("Result of multiplication", "\n")
print(result)
```

```
# Divide the matrices
result <- matrix1 / matrix2
cat("Result of division", "\n")
print(result)
```

When we execute the above code, it produces the following result –

```
      [,1] [,2] [,3]
[1,]    3  -1    2
[2,]    9   4    6
      [,1] [,2] [,3]
[1,]    5   0    3
[2,]    2   9    4
Result of multiplication
      [,1] [,2] [,3]
[1,]   15   0    6
[2,]   18  36   24
Result of division
      [,1]      [,2]      [,3]
[1,]  0.6      -Inf  0.6666667
[2,]  4.5  0.4444444  1.5000000
```
